

## **Abstract**

**Title:** Solutions of the offensive futsal combinations

**Objectives:** The main aim of this thesis is to analyse and illustrate the solutions of the offensive combinations as considered through the lens of the match process.

**Methods:** The data were collected via the nonparticipating observations of the video recordings of the AC Sparta Praha matches. Categorical system of observation to compare the particular components of the match was employed in order to lay down the correctness of the hypotheses. The resulting values were statistically processed based on the written data. The commentary files were filled in via dashing and writing notes.

**Results:** Through the observations, the combinations leading to scoring the goal were found, and the key aspects of the successful executions were laid out. More possible variants of executing the offense were found. The higher success rate was found when combining the gradual offense, quick counter-offense after gaining the ball, end-play executed from the centre of the field and also against the defence active in the defender's half of the field.

**Keywords:** game performance, offensive combinations, game situations, analysis, training proces
